## Start developing on the world's first autonomous data network

Decentralised, private, secure and infrastructure free. Get the tools and support you need to start building.

### The privacy-first network

Privacy and anonymity for your users. The Secure Access for Everyone (SAFE) Network is built to negate the prying eyes of internet interlopers with built-in encrypted communications.

### Open source

All SAFE Network libraries are open source, transparent and free to use.

### Network-wide sign-on

You don't need to roll-your-own account management solutions, users log in once at the network level. With SAFE you have no passwords left to lose!

### Infrastructure-free

Easy to use APIs in many languages, means you can focus on coding. No need to worry about your infrastructure or scaling costs here!

### Your application is the product, not your users' data

Users are always in control of their data, and with monetisation being built into the network, you can focus on making the best app, without selling your users short.

### Truly collaborative applications

With data owned by users, you can share data across applications to create and reuse data sets in new ways!
